There are so many angles to this topic that I am sure others will report on, as I just wish to comment on one aspect.

In relation to electricity generation why are people hung up on wind power generation? This sources of power will always be erratic and never be capable of replacing fossil fuels for consistency.

To do so we need a mix of many sources of renewable power eg solar, tidal, wave etc. This country also had numerous water mills on rivers many of whom could be reconstructed and converted to produce ecologically friendly consistent electricity with the right approach that will not interfere with biodiversity.

A plan to use a combination of many sources of raw power (and adapting the grid for the same) would be much better and more likely to deliver carbon neutrality for the energy sector than putting all our eggs in the wind power basket!

This concept needs to be accepted immediately.
Regards
